COMMERCIALLY EXPORTABLE SATELLITE GROUND SYSTEMS NOW AVAILABLE

Telemetry 500 Satellite Ground Networking Products Ruled Commercial

Colorado Springs, CO, December 11th, 2008 – RT Logic, a wholly owned subsidiary of Integral Systems, Inc. (NASDAQ-ISYS), today announced the international commercial availability of the proven T500 product series to provide data processing, protocol gateway, data recording and multiplexer capabilities for CCSDS satellite ground network applications. The T500 products have been reviewed by Commerce Jurisdiction (CJ) and designated an Export Classification Control Number (ECCN).

The exportable T500 products - comprised of the T500GT Protocol Gateway, T500MX Multiplexer, T500RX Recorder and the T500HR High Rate Mission Data Processor - connect commercial TT&C software systems with standard networks and satellite modems. These software-defined systems implement standard CCSDS Telemetry and Telecommand protocols, as well as other common commercial IP-based protocols. The systems support both low-rate satellite TT&C and high-rate (to 1Gbps) remote sensing applications.

The T500 systems leverage today's commercial server platforms to provide the industry's most flexible and cost-effective solution. A wide range of peripheral and storage choices, along with high reliability features including hot-swappable power supplies and disks, make the T500 systems the ideal choice for network-centric satellite ground applications.

“The T500 series offers a comprehensive turn-key ground system solution for commercial satellite ground networks” commented Rob Andzik, Business Area Manager in RT Logic's Data Processing and Networking Segment. “These standards-based products combine world class commercial technology with widely proven satellite ground algorithms. The commercial T500 line of products brings a superior value proposition to the international space community.”
